

Headline: Effects of Global Warming

By: Jack

Date: Thursday 15 March 2018

Recently, the President of the USA announced that he was going to leave the Paris agreement. This will have a big knock on effect on the world's future emissions. The Paris Agreement was started in 2015 on climate change. Around that time, some of the poorest countries in the world announced that they were moving towards 100% green energy. This is a major stepping stone towards a cleaner climate.

The main goal of the Paris Agreement is to keep the global temperature well below 2 degrees Celsius. They aim to limit the increase to 1.5 degrees Celsius, because this would significantly reduce the impact of climate change.

It would be best if global emissions peaked as soon as possible, although it is very possible that this will take longer because of developing countries.

Countries have submitted their own plans for future carbon emissions, but they are not yet enough to keep global warming temperatures below 2 degrees Celsius.

The future effects of Donald Trump pulling out of the Paris agreement will be very drastic and will force the global temperature higher. America has a large impact on the world and will have a negative outcome on the global temperature. America accounts for 27% of worldwide carbon emissions.

In 2017, the UK carbon emissions dropped to the lowest level since the 19th century. That was a large step environmentally and hopefully Britain and the rest of the world will keep on like that.
